ESM Fig. 2

ESM Fig. 2 shows the coefficients when dummy variables are added for year in the cox-regressions with the reference year being mortality in 2011. While there is considerable variability in year to year mortality rates there is limited evidence of systematic non-linear trends over time with either mortality for those with type 1 diabetes or when considering mortality relative to the general population.

ESM Fig 2. Exploring the possibility of more flexible trends in the Cox-regression models (a) Men – non-linear mortality trend controlling for age at diagnosis (b) Women - non-linear mortality trend controlling for age at diagnosis (c) Men –non-linear relative mortality trend controlling for age at diagnosis (d) Women - non-linear relative mortality trend controlling for age at diagnosis
