Supplemental Fig. 1 (a) Heart rates and (b) ventilation rates of -1°C (n=6), 2°C (n=6) and 4.5°C (n=5) -acclimated T. bernacchii during an acute increase in ambient temperature. Values are means ± s.e.m. Statistical significance was calculated for each temperature and is denoted by ‘a’ if the value is significantly different from heart rate or ventilation rate measured at a given temperature compared to -1°C acclimation group and ‘b’ if the value is different from 2°C acclimation group (ANOVA, p<0.05).
