Fig 1: Values of basal fluorescence ($F_t$, $F_0$ during dark, a), maximum fluorescence ($F_{m'}$, $F_m$ during dark, b), temperature (T, c) and photosynthetic photon flux density (PPFD, d) in the two thalli of *Umbilicaria aprina* that did not show metabolic activity (no Yield values) during the whole measuring period in Garwood Valley, Dry Valleys, continental Antarctica.
