Supplementary Figure 1. ATRX immunohistochemical staining of a tissue microarray, with examples of a negative and a positive core at high magnification.
Supplementary Figure 2. GBM samples age distribution between wild type and mutants in ATRX (a) and IDH (b). Whiskers represent 10-90 percentile
ATRX alteration is frequent in astrocytomas and oligoastrocytomas, but does not target oligodendrogliomas. [3,15]
Supplementary Figure 4. Examples of negative and positive alternative lengthening of telomeres in adult gliomas assessed by FISH.
