Fig. 1 Example of C5b-9 expression: areas of scattered positivity (A: 10x) together with positivity in the vessel walls (internal positive control) (B: 40x)
Fig. 2 Example of fibronectin expression as patchy fashion in the cytoplasm of a group of myocytes (A: 20x; B: 40x). Fibronectin positivity in arterial walls together with interstitial staining and slight cytoplasmic positivity (C: 40x).
Fig. 3 Example of dystrophin expression: normal pattern as sarcolemmal staining encircling myocytes (A: 40x); pathological staining as areas of complete loss of staining and areas of partial loss (B: 40x).
