Fig. S2. Photomicrograph showing cryosections of the dog ileum in which the mucosal blood vessels showed immunoreactivity for the CB2 receptor (a) and platelet endothelial cell adhesion molecule (CD31) (b). Open arrows indicate capillaries in which the two markers were co-localized, as visible in the merge image (c); white arrows indicate small areas in which the two markers were non overlapped, indicating that other cellular types (likely pericytes) showed CB2 immunoreactivity. Scale bar: a-c, 50 µm.
