Supplemental Figure 1. Sequence Analysis of the WT and Variant Splice Products
Supplemental Figure 1. Sequence analysis of the 404 bp and the 235 bp transcripts from cells transfected with wild type or variant vectors. A) RT-PCR product from cells transfected with wild-type vector (left lane) or variant vector (right lane). B) Chromatograms show sequences of the 404 bp and 235 bp amplicons. These demonstrate that the 404 bp band represents a properly spliced transcript with exon 25 retained and the 235 bp band represents an improperly spliced transcript lacking exon 25.
