Supplementary Fig. S2

The ballooning of human colonic organoid by KAG-308. Low-power field pictures of Figure 1a were shown. After the passage of the organoids (0h), the organoids were treated with or without KAG-308. Treatment with KAG-308 for 144 h (6 days) had no effect on the size of the organoid whereas treatment with KAG-308 for 24 h significantly expanded the sizes of the organoids because of fluid collection. Scale bar: 1000 µm
