Supplementary Figure 5.  *Agonist stimulation leads to Akt/GRK2 disassociation in injured sinusoidal endothelial cells*. Sinusoidal endothelial cells from BDL rat livers were isolated and cultured for 24 h, then cells were serum-starved and exposed to ET-1 (10 nM) for 30 min. Cell lysates (100 µg total protein) were subjected to immunoprecipitation with anti-Akt, followed by immunoblotting with anti-GRK2 antibody as in the methods. The blot shown is representative of 2 others.
