Experimental design

1. Sample size
   Describe how sample size was determined. We have chosen our sample size to ensure adequate power. This is based on our pilot and exploratory experiments.

2. Data exclusions
   Describe any data exclusions. We did not exclude any plant from our analysis.

3. Replication
   Describe whether the experimental findings were reliably reproduced. Complete experiments were repeated at least three times with similar results.

4. Randomization
   Describe how samples/organisms/participants were allocated into experimental groups. Our samples/plants were random.

5. Blinding
   Describe whether the investigators were blinded to group allocation during data collection and/or analysis. Investigators were not blinded to group allocation during data collection and/or analysis.
   Note: all studies involving animals and/or human research participants must disclose whether blinding and randomization were used.

6. Statistical parameters
   For all figures and tables that use statistical methods, confirm that the following items are present in relevant figure legends (or in the Methods section if additional space is needed).
   n/a  Confirmed
   - The exact sample size \( (n) \) for each experimental group/condition, given as a discrete number and unit of measurement (animals, litters, cultures, etc.)
   - A description of how samples were collected, noting whether measurements were taken from distinct samples or whether the same sample was measured repeatedly
   - A statement indicating how many times each experiment was replicated
   - The statistical test(s) used and whether they are one- or two-sided (note: only common tests should be described solely by name; more complex techniques should be described in the Methods section)
   - A description of any assumptions or corrections, such as an adjustment for multiple comparisons
   - The test results (e.g. \( P \) values) given as exact values whenever possible and with confidence intervals noted
   - A clear description of statistics including central tendency (e.g. median, mean) and variation (e.g. standard deviation, interquartile range)
   - Clearly defined error bars

See the web collection on statistics for biologists for further resources and guidance.
Software

7. Software

Describe the software used to analyze the data in this study. Imaris 8.3, ImageJ and OriginPro softwares have been used in this study.

For manuscripts utilizing custom algorithms or software that are central to the paper but not yet described in the published literature, software must be made available to editors and reviewers upon request. We strongly encourage code deposition in a community repository (e.g. GitHub). Nature Methods guidance for providing algorithms and software for publication provides further information on this topic.

Materials and reagents

8. Materials availability

Indicate whether there are restrictions on availability of unique materials or if these materials are only available for distribution by a for-profit company. No restrictions of materials availability

9. Antibodies

Describe the antibodies used and how they were validated for use in the system under study (i.e. assay and species). N/A

10. Eukaryotic cell lines

a. State the source of each eukaryotic cell line used. All yeast strains are sourced from ATCC as described in material and methods

b. Describe the method of cell line authentication used. N/A

c. Report whether the cell lines were tested for mycoplasma contamination. N/A

d. If any of the cell lines used are listed in the database of commonly misidentified cell lines maintained by ICLAC, provide a scientific rationale for their use. N/A

Animals and human research participants

11. Description of research animals

Provide details on animals and/or animal-derived materials used in the study. N/A

12. Description of human research participants

Describe the covariate-relevant population characteristics of the human research participants. N/A
