Figure A1  Comparison of empirical and experimental data on editing co-occurrences. White cells are explained by the null model, shades of blue/red show the distance of observed co-occurrences from the lower/upper border of the confidence interval. Low explained variation (11%, 95% confidence level), suggests that non-random processes are in place. Based on a random 6.5% data (N = 200,748 concepts).
