Figure 5

The graph illustrates the secretion of PSA (ng/ml) over time (h) in different conditions: Con, BFA, DHT, and BFA/DHT. The y-axis represents the concentration of secreted PSA, and the x-axis represents time in hours (0, 24, 48, 72). The data points show significant increases in PSA concentration over time for the BFA and DHT conditions compared to the control (Con) and BFA/DHT groups. The significance levels are indicated by asterisks (* and **) on the data points.
