Impact of window size on the number of layers. Average on 20 benchmarks. 1000 SNPs processed, \( a = 0.2, b = 2, \) \( \text{card}_{\text{max}} = 20, \) \( t_{\text{CAST}} = 0.95, \) \( t_{\text{MI}} = \text{quantile}_{\text{MI}}(0.5), \) \( t = 0.5 \) (for CFHLC parameter description, see text, Section Algorithm). 

Like the number of latent variables, the number of layers increases with the window size.
