Welcome to the openBEB Mac Installer

This program installs openBEB in four steps:
1. If needed, the LabView 2012 libraries are installed
2. The openBEB CORE is installed in the Application folder
3. openBEB CORE is started
4. openBEB CORE installs the extension folder

Welcome to openBEB

It is your first time running openBEB CORE application.

The browser uses your institutional e-mail address for your identification in metadata files (no data will be transmitted):

```
e-mail
```

To work properly, the CORE program needs an extension folder with definition files and executables. The newest extension folder will be downloaded from a public repository. This can take several minutes. If the server cannot be reached, a bundled version of the extension folder will be installed.

Downloading Extensions (Step 2 of 4)
