The diagrams illustrate the number of sequences for different species and the variant frequencies per sample. The species and their respective variant frequencies are as follows:

- **Myodes glareolus** with $m = 4$
- **Maxomys surifer** with $m = 8$

Each diagram shows the number of sequences on the y-axis and the variant frequencies (%) per sample on the x-axis.

**A** and **D** show the distribution for $m = 2$.

**B** and **E** show the distribution for $m = 4$.

**C** and **F** show the distribution for $m = 8$. 

The diagrams provide a visual representation of how the variant frequencies vary across different samples for each species.
