The image shows a gel electrophoresis analysis comparing the protein expressions of two strains, C57BL/6J and SEG/Pas, at different time points (d4, d8, d14). The gel is labeled with molecular mass markers (kDa) ranging from 6.5 to 83. Various protein bands are labeled with Greek letters (α, β, γ, ε, κ, and WAP) and other markers such as Lf and SA. The bands indicate differences in protein expression patterns between the two strains at different developmental stages.
