Figure S6. Effect of *cassini* on survival of drug-treated cells. Human 293 FT HEK cells transfected with pEGFP-C1 (expressing EGFP) or pEGFP-Cassini were assayed for (A), *cassini* RNA expression using real-time RT/PCR and (B) EGFP expression using FACS and (C, D) effect of *cassini* expression on cell growth, viability and chemotherapeutic drug treatment. C and D show independent transductions and experiments. All values represent mean ±SD of triplicate wells per treatment per transfectant. *p<0.05; **p<0.01; ***p<0.001.
