Suppl. Figure 6
Gene: *Prl6a1* (Prlpb)

**A**

*Prl6a1* is expressed early in the EPC as well as the antimesometrial decidua. Mesometrial decidua expression has not been observed. Later in gestation, with the formation of the spongiosotropic/blast/glycogen trophoblast layer around E10.5, it is clear that *Prl6a1* expression is restricted to GlyT cells. By E10.5, *Prl6a1* expression is not uniform throughout the GlyT population, while some *Prl6a1* (+) GlyT are seen above the TGC layer in the decidua and in proximity to spiral arteries, most *Prl6a1* (+) GlyT appear to be confined within the spongiosotropic layer itself. This is complementary to *Prl7b1* expression for example, which appears to be predominantly expressed in GlyT cells located above the TGC layer and within the maternal decidua, although there is clearly overlap of *Prl6a1* and *Prl7b1* expression in many cells. By E16.5, very few cells still express *Prl6a1*. Previous publications showing mouse *Prl6a1* expression: (Lin et al., 1997a; Muller et al., 1998).
