The graph shows the levels of IFN-γ (pg/ml) in PMNC and CD15+ve cells from Non-Infected and KHW-Infected groups treated with Control, IL-12, IL-18, and IL-12+IL-18.

- Non-Infected:
  - Control: Low levels of IFN-γ
  - IL-12: No significant increase
  - IL-18: No significant increase
  - IL-12+IL-18: Significant increase

- KHW-Infected:
  - Control: Low levels of IFN-γ
  - IL-12: No significant increase
  - IL-18: No significant increase
  - IL-12+IL-18: Significant increase
