The graph shows the concentration of DA (ng / 1×10^5 cells) in response to different concentrations of SDF-1α (ng / ml). The x-axis represents the concentration of SDF-1α ranging from 0 to 50 ng / ml, while the y-axis shows the concentration of DA from 0 to 1500 ng / 1×10^5 cells. The highest concentration of DA is observed at 1 ng / ml of SDF-1α, indicated by an asterisk (*) to signify statistical significance.
