Figure A shows the mRNA transcripts (thousands copies/200 ng RNA) for PinII and Protein P4 under different conditions (K, 4.1c, 9.4, 10.4). The bar graph indicates a significant increase in mRNA levels for each condition compared to control (K).

Figure B displays Western blots for PR-2 and PR-3 proteins under the same conditions (K, 4.1c, 9.4, 10.4). The blots show a consistent increase in protein expression across all conditions.

Figure C presents normalized content for PR-2 and PR-3 proteins across different lines (K, 9.4, 10.4, 4.1c). The bar graph highlights a significant increase in protein content for each line under each condition, as indicated by the asterisks.
