The graph shows the proportion of children not vaccinated against polio over time, with data divided into three phases: pre-shortage, shortage, and post-shortage. The x-axis represents age in months, ranging from 12 to 24, while the y-axis represents the proportion not vaccinated, ranging from 0.0 to 1.0.

- **Pre-shortage**: The proportion not vaccinated decreases gradually as age increases.
- **Shortage**: There is a significant increase in the proportion not vaccinated during this phase, especially around 16 months.
- **Post-shortage**: The proportion not vaccinated returns to a lower level, similar to pre-shortage, indicating a recovery phase.

Legend:
- pre-shortage
- shortage
- post-shortage
