167 Patients
Confirmed new diagnosis of Crohn’s disease OR highly suspected based on colonoscopy/imaging

167 Patients
Known Crohn’s disease with high clinical suspicion of relapse

334 Patients
-MRE and US performed by 2 blinded independent radiologists*
-Repeat blood and stool sample tests

Discrepancy for the presence of non-contiguous small bowel disease proximal to Terminal ileum on MRE and US

yes

Additional small bowel investigation eg Capsule endoscopy, BaF, CT

no

-Repeat blood and stool sample tests 3 months following instigation of therapy.

Total patient follow up 6 months-clinical course. All standard clinical practice diagnostic tests recorded.

Consensus panel composite reference standard for luminal disease presence, extent and activity (based on all ileo-colonoscopy, capsule endoscopy, imaging, histopathology, blood and stool test results) leading to a final therapeutic decision.

*IIF MRE already performed pre recruitment-blinded radiologist review
If US already performed pre recruitment-repeated by blinded radiologist
