Ileal Responses

A. Diet

![Graph showing the effect of diet on Ileal Responses. The x-axis represents the log concentration of Carbachol (M), and the y-axis represents Newtons (x10^2)/m^2. Two lines are plotted: one for Low Cholesterol and another for High Cholesterol. The graph shows a clear distinction between the two groups, with High Cholesterol responses generally being higher.]

B. TTX & High Cholesterol

![Graph showing the effect of TTX on Ileal Responses. The x-axis represents the log concentration of Carbachol (M), and the y-axis represents Newtons (x10^2)/m^2. Two lines are plotted: one for No TTX and another for TTX. The graph shows a clear distinction between the two groups, with TTX responses generally being lower.]

Key:
- Low Cholesterol
- High Cholesterol
- No TTX
- TTX
