Percent improvement in verbal memory performance over 1 year of cardiac rehabilitation (CR) in subjects with low and high C22:0 and C24:0 concentrations

![Graph showing percent improvement in verbal memory performance over 1 year of cardiac rehabilitation (CR) in subjects with low and high C22:0 and C24:0 concentrations. The graph compares the improvement in percent for the low and high concentrations of ceramide species C22:0 and C24:0. The data is represented with bars and error bars to indicate variability.](image-url)
