Figure 1: Proportion of Adverse Events and Number of Patient Frailty Characteristics

Frailty characteristics associated with adverse events during hospitalization = cognitive impairment, anemia, recent unintentional weight loss, and any potentially inappropriate medication prior to admission. \( n = \) number of patients in each group. Significant test of trend, \( R^2 = 0.25, \) \( p < 0.001. \)

Frailty characteristics associated with readmission within 30 days = hyponatremia, hospitalization within previous 30 days, and functional impairment. \( n = \) number of patients in each group. Significant test of trend, \( R^2 = 0.31, \) \( p < 0.001. \)
