Figure 3. Distribution of MRI-defined lesion types in patients presenting with DM 2 compared with nondiabetic patients. The high-risk lesion types IV-V and VI were more prevalent in diabetic patients compared with nondiabetic ones (n=20 [39.2%] vs. n=28 [21.7%] and n=9 [17.6%] vs. n=10 [7.8%]; P=0.002).
