The graphs show the change in eGFR (estimated glomerular filtration rate) over time for two groups: glomerular tip adhesion group on the left and non-glomerular tip adhesion group on the right.

- **Glomerular Tip Adhesion Group**
  - Initial eGFR: 140.0
  - Final eGFR: 20.0
  - **p = 0.0019**

- **Non-Glomerular Tip Adhesion Group**
  - Initial eGFR: 140.0
  - Final eGFR: 20.0
  - **p = 0.0011**

Both groups show a significant decrease in eGFR, indicating a decrease in kidney function, with the non-glomerular group showing a slightly more pronounced decrease compared to the glomerular group.
