Figure A: The graph shows the expression levels of Nrf2 mRNA normalized to GAPDH mRNA under two conditions: - (negative control) and + (treatment). The expression level under the treatment condition (+) is significantly lower than the control condition (-), indicated by the asterisk (*).

Figure B: The Western blot analysis (B) reveals the expression levels of Nrf2 and α-tubulin under the same conditions as in Figure A. The blots show a decrease in Nrf2 expression with the treatment (+), while α-tubulin expression remains consistent between the two conditions.
