Improving patients' QoL is more important to me than helping them to live longer.

Most ICHD patients find it a burden to travel to the clinic three times each week.

HH D provides patients with a better QoL than ICHD.

Longer, nocturnal dialysis sessions would result in better clinical outcomes than ICHD.

Increasing dialysis frequency beyond three times per week improves clinical outcomes.

HH D provides better clinical outcomes than PD.

ICHD is preferred because it allows closer monitoring of their condition.

Longer, nocturnal dialysis sessions would result in better clinical outcomes than ICHD.
