Stage 1: Initial screening interview
Total number of participants = 3000

Screened positive for presence of tremors
N=234

Screened negative for presence of tremors
(and thus excluded from study)
N = 2766

Stage 2: Case ascertainment
Screened in 2 steps
N = 234
Step 1: 12-item ET specific questionnaire
Step 2: Neurologic examination

Step 1 outcome
Screened positive to 12-item ET specific questionnaire
N = 40

Step 2 outcome
Finally diagnosed as ET
N = 36

Excluded based on other diagnoses N = 4
Diagnoses: Parkinson’s disease=1; drug-induced parkinsonism=1; drug-induced tremor (salbutamol)=1; hyperthyroidism=1
