The diagram above illustrates the odds ratio of interpregnancy intervals for Canadian-born and foreign-born mothers. The x-axis represents the interpregnancy interval categories: Short, Intermediate, Long, and Firstborn. The y-axis denotes the odds ratio with values ranging from 0.6 to 2.2.

- **Canadian-born mothers**: The odds ratios are 1.95, 1.60, 1.31, and 1.26, respectively, for Short, Intermediate, Long, and Firstborn categories.
- **Foreign-born mothers**: The odds ratios are 1.57, 1.41, 1.30, and 1.03, respectively, for Short, Intermediate, Long, and Firstborn categories.

The data suggests that the odds ratio decreases with an increase in the interpregnancy interval for both groups, but the decrease is more pronounced for foreign-born mothers.
