The graph shows the rate per 100,000 person-years for different years of diagnosis, categorized by gender and race. The rates are indicated for White males, Black males, White females, and Black females. Over the years, there is a general trend of increasing rates for all groups, with White males having the highest rates and Black females having the lowest rates in some years. The years of diagnosis range from 1975-77 to 2005-07.
