Supplementary Figure S4: Immunocytochemistry of 786-O cells transduced with lentivirus expressing SAV1 or control virus using anti-SAV1 antibody

786-O cells were transduced with pLenti6.3/V5-DEST empty vector or SAV1-pLenti6.3/V5-DEST, and 2 cell lines that express SAV1 (SAV1-1 and SAV1-2) and a control cell line that were transduced with empty vector alone (control) were established. Immunocytochemistry of these cells with anti-SAV1 antibody evidently shows that the antibody is specifically immunoreactive with SAV1.
