raw data from travel team

- screening of chart records/medical reports, identification of missing records
- collection of all psychiatric discharge letters of every single patient
- careful study & preprocessing of all collected information

- determination of age of onset, duration of prodromal symptoms, medication history, pattern of course, psychiatric and medical comorbidity
- confirmation of consensus diagnosis based on chart records (e.g. first diagnosis, first psychotic episode, current diagnosis, differential diagnosis)

- analysis and entering of questionnaire data, rating scales and neuropsychological tests

- continuous training and calibration sessions of all raters and research assistants
- meticulous double-check of entered data

result: data bank of > 3,000,000 phenotypic data points
