Stimulus level (dB peSPL) vs. Response and Noise:

- **Response** line shows a steady increase in dB SPL with increasing stimulus level.
- **Noise** line remains relatively constant across stimulus levels.

Stimulus level (dB peSPL) vs. Stimulus Stability and Whole Reproducibility:

- **Stimulus Stability** line shows a gradual increase, indicating better stability with higher stimulus levels.
- **Whole Reproducibility** line also shows an increase, though less steeply than Stimulus Stability.

Both graphs include error bars representing variability across different stimulus levels.
