Figure A shows the swelling (% over time) for different treatments: Control, EtOH BP100, EtOH BP300, and Indomethacin. The graph indicates a significant increase in swelling over time for all treatments, with the EtOH BP300 and Indomethacin treatments showing the highest initial swelling.

Figure B presents a bar chart comparing swelling (%) at 4 hours for the same treatments as Figure A. The chart shows that EtOH BP300 and Indomethacin have higher swelling percentages compared to the Control and EtOH BP100 groups.

Statistical significance is denoted by * and **, indicating a significant difference compared to the Control group.
