Figure 4

(a) Cumulative Stereotypies Index over time for different groups: VEH, METH 5mg, MMC 1g, MMC 3g, MMC 5g. The graph shows a peak at approximately 15-30 minutes for METH 5mg and a gradual decline for other groups.

(b) Bar graph comparing Cumulative Stereotypies Index among groups. VEH shows the highest values, followed by METH 5mg, and then MMC groups with decreasing values. The graph includes error bars indicating variability.

(c) Climbing Time (min) for different groups. VEH has the highest climbing time, while METH 5mg and MMC 1g have significantly lower times compared to VEH. The graph includes error bars showing variability.
