Figure 5

The figure shows the viability percent (%) of different extracts (Petroleum ether, Acetone, Methanol) at various concentrations (5 µg/ml, 10 µg/ml, 20 µg/ml, 40 µg/ml, 80 µg/ml). The data is represented with error bars indicating variability. Different letters (a, b) above the bars indicate significant differences in viability at p < 0.05 according to Tukey’s test.
