Figure 10

![Graph showing the level of total thiol (nmol/mg protein) for different treatments. The x-axis represents the time of treatment (Pre-treated, Post-treated), and the y-axis shows the level of thiol. The treatments include Cont, GalN, P+GalN, VitE+GalN, BSA+GalN, GalN+P, GalN+VitE, and Recovery.](image)

- Cont
- GalN
- P+GalN
- VitE+GalN
- BSA+GalN
- GalN+P
- GalN+VitE
- Recovery

The graph shows significant differences between the treatments, with Post-treated groups generally having lower levels of thiol compared to Pre-treated groups. ANOVA analysis indicates that the differences are statistically significant.
