The graph shows the change in Cremophor EL percentage over time for two different start concentrations: 0.5% (closed circles) and 1% (open circles). The x-axis represents the minutes incubated at 37°C, while the y-axis represents the percentage of Cremophor EL. The data points indicate a decrease in Cremophor EL concentration over time for both concentrations, with the 1% concentration showing a more rapid decrease compared to the 0.5% concentration.
