1) Determine patient age and gender

2) Look up age-gender incidence of AD

3) Determine time to AD ($t_{AD}$) by estimating time between age-gender incidence as an exponential (See Figure 1)

4) Determine time to all cause mortality ($t_d$)

5) Calculate extended time of incident AD due to treatment effectiveness

6a) Calculate ADFYs gained and AD case avoided

6b) Calculate ADFYs gained
