Figure 1. Mean levels of sHLA-G from birth (cord blood) to one year old (3, 6, 9, 12 months)

The proportion in whom sHLA-G was detectable was 60% in cord blood and respectively 33%, 44.25%, 53.51% and 54.13% in 3, 6, 9 and 12 month old infants. Ranges of sHLA-G from birth (cord blood) through infancy (3, 6, 9, 12 months) were respectively [0-128.5], [0-98.4], [0-123.6], [0-144.2] and [0-110.6].
