Trends in number of malaria cases in the Karelian Isthmus compared with the rest of Finland

The graph shows the number of civil malaria cases from 1923 to 1944. The x-axis represents the years, and the y-axis represents the number of civil malaria cases. The bars are color-coded to indicate whether the cases are in the Karelian Isthmus (red) or in Finland excluding the Karelian Isthmus (blue).

Key events marked on the graph:
- Winter War
- Continuation War
- The Karelian Isthmus fortification

The number of malaria cases in the Karelian Isthmus is significantly higher than in the rest of Finland during the years 1928 and 1942-1944.
