Figure 1: Mean cellular responses in malaria exposed and un-exposed individuals. Responses to wildtype-MSP119 antigen, modified MSP119 constructs, PHA, GST and F32 (a percoll extracted crude malarial antigen prep.) in 7 malaria-exposed individuals (shaded boxes) and five malaria-unexposed (naïve) individuals (open boxes). The malaria-exposed individuals showed significantly higher responses to all the malaria antigens than the malaria-unexposed individuals ($P = 0.001$).
