Figure 3c. Scatter plots showing median and interquartile range of C5a levels in severe malarial anaemia (cases) and those with uncomplicated malaria (controls).

The median level in the cases (34.3 ng/mL, 27.7-68.2) was comparable to the level in the control group (30.7 ng/mL, 28.1-35.8), \( P = 0.35 \). Wilcoxon matched-pairs signed-ranks test was performed with the 54 paired samples.
