Figure 1

Figure 1 showed comparison of BP evolution by longitudinal analysis between SS and NSS adolescents. After 18 years, BP of the SS group increased largely, with both SBP and DBP significantly higher than those in NSS group (SBP : $P<0.01$, DBP :$P<0.05$).

**Figure 1. Blood Pressure Evolution Followed up 18-Year in SS and NSS Groups**

Compared with SS group, * $P<0.01$  **$P<0.05$.
