Two approaches:
1. Constant fortification throughout the year (see 2A, 3A)
2. Varying fortification throughout the year (see 2A, 3A)

The dotted cube depicts the maximum fortification intensity that is being considered in our fortification model.

On the x-axis it considers individuals with a currently very low vitamin D intake (5th percentile).
On the y-axis it considers individuals with an low intake of the vitamin D carrier product.
On the z-axis it considers individuals who tend to have a 25(OH)D concentration of 75 nmol/L.

Fortification steps considered in the maximum fortification scenario.
