Main tissue expression:
tissues exhibiting high carbolic rates of fatty acids
(mainly liver and skeletal muscle)
Other tissues:
cardiomyocytes, kidney, intestinal mucosa, and brown adipose tissue

Tissue expression:
ubiquitous, however the biggest expression is in gastrointestinal tract
(esophageous, liver, intestines) kidneys and skeletal muscle

Main tissue expression:
adipose tissue (white and brown)
Other tissues: intestines, liver, kidneys, retina, immunologic system (bone marrow, lymphocytes, monocytes and macrophages), trace amounts in muscles
