ITT Population included subjects who consumed the study product and had energy intake assessed at the test meal at baseline and week 3. PP population included all ITT subjects who completed the study without any protocol violations, and took at least 54 doses of the assigned study treatment. Overall, 7 subjects were excluded from the PP population due to major protocol violations. Six subjects did not comply with product usage and one subject did not meet the inclusion/exclusion criteria. This subject was enrolled inadvertently in the study, less than four weeks after discontinuation of antibiotics. Additionally, 8 subjects did not return for week 3 visit, 4 of them took a prohibited medication and were not included in the PP or ITT populations. The efficacy parameters were analyzed on ITT population.

AE=Adverse Event; ITT=Intention-to-treat; PP=Per Protocol
